

VYLO PMS

PRIVATE • PRECISE • POWERFUL

AI Disclosure

v1.0.0 • 2026-09-04

1. Overview

Vylo PMS includes two AI-assisted features, each of which runs entirely on your own computer using a locally-installed AI model (Llama 3.2 3B, via Ollama) -- no cloud AI service is used, and nothing you type or hold in your portfolio is sent to a cloud AI service for either feature.

2. Feature 1: Instrument Classification Suggestions

When you add a new stock, mutual fund, or other instrument, Vylo PMS can suggest its sector and geography classification. This suggestion is always shown for your review, field by field; nothing is saved to your portfolio until you explicitly accept it. If the model can't classify an instrument with reasonable confidence, the App tells you so and asks you to enter it manually rather than guessing silently.

3. Feature 2: Financial-Literacy Assistant

A built-in assistant explains portfolio and risk terminology in plain language as you encounter them in the App. It answers from a fixed set of definitions and explanations built into the App -- it is designed to explain concepts, not to generate open-ended financial advice or recommendations. Its answers should be treated as educational, not as a recommendation to buy, sell, or hold any investment (see the Terms of Use, Section 7).

4. Setup Requirement

Both features need a one-time local setup step (installing Ollama and pulling the AI model) to activate. Until that step is completed, they show a clear message explaining what to do, rather than failing silently or producing incorrect output.

5. Data Used by AI Features

Instrument classification uses the details you've entered about that instrument to generate its suggestion. The financial-literacy assistant uses the question you type. Neither feature sends this data anywhere off your device -- the model runs locally.

6. Related Data Flows (Not AI, But Sometimes Confused With It)

For transparency, two other data flows sometimes get bundled into "what does the AI do" -- spelled out here to be precise:

- Price data is fetched from third-party market-data providers (Twelve Data and Yahoo Finance) using only the instrument's ticker symbol -- this is not an AI feature, and no AI model is involved.
- File imports: a structured spreadsheet import uses straightforward column matching (no AI); uploading a broker statement uses a document-parsing tool to read tables on the page -- not the same AI model used for classification/glossary -- and extracted rows are always staged for your review before anything is saved.

7. Known Limitations

Neither AI feature has been through a formal, benchmarked evaluation as of this release -- verification so far has been manual spot-checking during development, not a measured accuracy or hallucination rate. Both features are

structurally limited (grounded suggestions/retrieval, not open-ended generation) as a design choice to reduce this risk, but that is a mitigation, not a guarantee.
