FIRST PUBLIC RELEASE

Overview

Vylo PMS v1.0.0 is the first public release of a local-first portfolio management app for individuals, families, and small advisory practices -- stocks, mutual funds, ETFs, direct real estate, and physical gold in one place, with guided planning and reporting built in.

What's New

See your whole portfolio in one place

Stocks, mutual funds, ETFs, direct real estate, and physical gold are tracked side by side, with full buy/sell/void transaction history for each.

A planning workflow that actually adapts to you

A 7-step guided flow -- requirements, risk appetite, target allocation, gap analysis, and a monthly investment plan -- instead of a static spreadsheet you have to maintain by hand.

Never miss a recurring investment

Auto-generate and track payment schedules for SIPs, EMLs, and recurring purchases, matched automatically against the transactions you record.

Get back in without email

Self-service password recovery via one-time recovery codes -- no email server, no waiting on a reset link.

A statement you can actually hand someone

Institutional-style PDF reports, generated from your real data, ready to share with an advisor or keep for your own records.

Built for more than one person

Owner, Family Member, and Advisor roles with admin controls, so a household or small practice can share one installation with the right boundaries in place.

AI & Model Updates

Smarter category suggestions, always reviewed by you

When you add a new stock or fund, Vylo can suggest its sector and geography for you to accept or correct -- it never saves a guess without your say-so.

Ask about a financial term, right where you're using it

A built-in glossary assistant explains portfolio and risk terms in plain language as you come across them.

AI Usage & Limitations

Vylo PMS includes two AI-assisted features: suggested sector/geography classification when you add a new instrument, and a financial-literacy assistant that explains portfolio and risk terms. Both run entirely on your own computer using a local AI model -- nothing you type or hold in your portfolio is sent to a cloud AI service. Classification suggestions are always shown for your review; nothing is saved until you accept it. The

financial-literacy assistant answers from a fixed set of definitions and explanations built into the app -- it explains concepts, it doesn't generate open-ended financial advice, and its answers should be treated as educational rather than a recommendation to buy, sell, or hold any investment. Both features need a one-time local setup step to activate; until then, they show a clear message rather than failing silently.

Price data

Current and historical prices are fetched from third-party market-data providers (Twelve Data and Yahoo Finance) so your holdings stay valued against real market prices. This is the one place data does leave your computer -- but only the instrument's ticker symbol is sent to look up its price; your holdings, portfolio value, and personal details are never included in that request.

File imports

Vylo PMS reads transaction and holdings data from two kinds of uploads. A structured spreadsheet (using the app's own template) is read by straightforward column matching -- no AI involved. Uploading a broker statement or similar document uses a document-parsing tool to read the tables on the page; either way, the extracted rows are always staged for your review and nothing is added to your portfolio until you confirm them.

Where it's all stored

Every import, AI suggestion, and refreshed price is written to your own local database on your own machine -- none of it is uploaded to a cloud server.

Breaking Changes

None. This is the first release.

Known Issues

- Windows may show a "Windows protected your PC" prompt the first time you run the installer -- this is a standard first-run recognition check, not a sign of a problem. See the install guide for the two clicks past it.
- The category-suggestion and glossary-assistant features need a one-time local AI setup step to activate. Until that's done, they show a clear message explaining what to do rather than a working suggestion.

Deprecations

None. This is the first release.
